## Unit 8: Operations with Rational Numbers Standards, Checklist and Circle Map

## Georgia Standards of Excellence (GSE):

MGSET.NS.1a: Describe situations in which opposite quantities combine to make 0 . MGSE7.NS.1b: Understand $p+q$ as the number located a distance $|q|$ from $p$, in the positive or negative direction depending on whether $q$ is positive or negative. Show that a number and its opposite have a sum of 0 (are additive inverses). Interpret sums of rational numbers by describing real-world contexts.

MGSET.NS.1c: Understand subtraction of rational numbers as adding the additive inverse, $p-q=p+(-q)$. Show that the distance between two rational numbers on the number line is the absolute value of their difference, and apply this principle in real-world contexts.
MGSE7.NS.1d: Apply properties of operations as strategies to add and subtract rational numbers.
MGSET.NS.2a: Understand that multiplication is extended from fractions to rational numbers by requiring that operations continue to satisfy the properties of operations, particularly the distributive property, leading to products such as $(-1)(-1)=1$ and the rules for multiplying signed numbers. Interpret products of rational numbers by describing real-world contexts.
MGSET.NS.2b: Understand that integers can be divided, provided that the divisor is not zero, and every quotient of integers (with non-zero divisor) is a rational number. If $p$ and $q$ are integers, then $-(p / q)=(-$ $p) / q=p /(-q)$. Interpret quotients of rational numbers by describing real-world contexts

MGSE7.NS.2c: Apply properties of operations as strategies to multiply and divide rational numbers.
MGSET.NS.2d: Convert a rational number to a decimal using long division; know that the decimal form of a rational number terminates in 0 s or eventually repeats.
MGSET.NS.3: Solve real-world mathematical problems involving the four operations with rational numbers.

What Will I Need to Learn?? Mark a check next to each concept as you master them.
$\qquad$ I can show integer addition and subtraction on a number line
$\qquad$ I can understand that the sum of opposites is zero
$\qquad$ I can add and subtract integers, including in real-life situations
$\qquad$ I understand that subtracting is the same as adding the inverse
$\qquad$ I can multiply integers
$\qquad$ I can divide integers
 I can convert fractions (rational numbers) to decimals
$\qquad$ I can solve problems with rational numbers

## Application

12) Order from least to greatest: $-\frac{1}{4},-\frac{6}{8}, 1 \frac{4}{5},-0.5,1.4$
13) If $b$ represents a negative number, is $b \cdot b$ a positive or negative number?
14) A submarine 530 feet below sea level descends an additional 100 feet before ascending 120 feet. What is the location of the submarine?
a) 750 ft below sea level
b) 550 ft below sea level
c) 510 ft below sea level
d) 510 ft above sea level
15) Name two integers have a product of -30 and a sum of -7 .
16) The temperature at 9 AM was $11^{\circ} \mathrm{F}$. The temperature dropped 4 degrees per hour for the next three hours. What is the temperature at noon?
a) $-3^{\circ} \mathrm{F}$
b) $-7^{\circ} \mathrm{F}$
c) $-1^{\circ} \mathrm{F}$
d) $-2^{\circ} \mathrm{F}$
17) What addition expression is represented by the model below?

18) What subtraction expression is represented by the model below?

19) When the following fractions are converted to decimals, which one will result in a repeating decimal?
A. $\frac{7}{10}$
B. $\frac{5}{12}$
C. $\frac{5}{8}$
D. $\frac{3}{5}$
20) For your birthday, you decide to go parasailing over the ocean. You're peacefully sailing at 120 feet above sea level, and then you ascend 25 feet. Finally, you decide to dive into the ocean, and you fall 165 feet. Describe your new location. Justify your answer with an illustration, an equation, and/or complete sentences.

Solve for $x$ in each equation below. SHOW ALL STEPS:
$21 . x-4.23=-9.05$
22. $-8 x=-60$
23. $x+4=-91 / 4$
25. $31 / 2 x=-70$
24. $\frac{x}{-5}=-10$
26. $x+8=-42$

Subtraction Fractions with UNLIKE denominators

$$
\frac{5}{6}-\frac{3}{9}=
$$

1. Find the LCM of the denominators. This is your new denominator.

$$
\begin{array}{ll}
\text { Mumpins of } 3-1.12 .18 \\
\text { Mumples of } 3+2.18 .27
\end{array} \quad \text { LCM }=18
$$

2. Rewrite the problem using the LCM.

$$
\frac{5}{6} \times 3=\frac{3}{9 \times 2}=\frac{15}{18}=\frac{6}{18}
$$

3. Subtract the numerators. The denominator stays the same.

$$
\begin{gathered}
\frac{15}{18}-\frac{6}{18}=\frac{9}{18} \\
\frac{9}{18}+8=\frac{1}{2}

Adding Integers

Adding the SAME Sign

## Adding Rational Numbers

To add rational numbers with the same sign, add their absolute values.
The sum is:

- positive if both integers are positive.
- negative if both integers are negative.

To add rational numbers with different signs, subtract their absolute values.
The sum is:

- positive if the positive integer's absolute value is greater.
- negative if the negative integer's absolute value is greater.
- Remember: What do you have more of, positives or negatives, and how many more do you have?

## Examples:

1. Find $-3+(-2)$.

Start at 0 . Move 3 units down to show -3.

From there, move 2 units down to show -2 .

So, $-3+(-2)=-5$.

2. Find $\mathbf{- 2 6}+(\mathbf{- 1 7})$.
$-26+(-17)=-43$
3. Find $5+(-3)$.

So, $5+(-3)=2$.
So, $-3+2=-1$.

Find the sum using two-color counters.
Find $-3+(-2)$.

Three negatives (-3) plus another two negatives (-2) gives you five negatives ( -5 ).

Find $5+(-3)$.

First, match up your zero pairs.

**Remember that the sum of a number and its opposite is always 0 . A number and its opposite are zero pairs.**

Then cross out your zero pairs.

There are three
positives left so,
$5+(-2)=3$.

## You Try:

Use (+) and (-) counters or a number line to find the sum.

1) $-5+(-2)$
2) $8+1$
3) $-7+10$
4) $16+(-11)$
5) $-22+(-7)$
6) $-50+50$
7) $-10+(-10)$
8) $100+(-25)$
9) $-35+(-20)$

Use any method to find the sum.
10) $-7+(-3)+10$
11) $-42+36+(-36)$
12) $-17+17+9$
13) $5+(-8)$
14) $-3+3$

~ Subtracting Integers ~

Example 1: Subtract $5-(-8) \rightarrow$ Instead of subtracting -8, ADD positive 8

Example 2: Subtract $-3-(4) \rightarrow$ Instead of subtracting 4, ADD negative 4

Why does this work?? Take a look at the visuals below:
Using a number line:
$2-(-3)=$
If you were subtracting $2-3$, you would start at 2 and
move back 3. But since you're subtracting a negative 3 ,
you'll do the opposite!!

$$
2--3=2++3=5
$$

Begin with 5 positive counters.
You don't have 3 negatives to take away, so you must add in enough zero pairs to be able to take 3 away. That leaves you with 8 positives!!

## Subtracting Rational Numbers

Are you able to add rational numbers? Then you are able to subtract integers.

To subtract an integer, add its additive inverse. In other words, you subtract rational numbers by adding the opposite.

## Examples:

1. Find 8-13.

$$
\begin{aligned}
8-13 & =8+(-13) & & \text { To subtract } 13, \text { add }-13 \\
& =-5 & & \text { Simplify. }
\end{aligned}
$$

Check by adding $-5+13 \stackrel{?}{=} 8$
$8=8 V$
2. Find - $\mathbf{1 0}-7$.

$$
\begin{aligned}
-10-7 & =-10+(-7) & & \text { To subtract 7, add }-7 . \\
& =-17 & & \text { Simplify. }
\end{aligned}
$$

$$
\text { Check by adding } \begin{aligned}
-17+7 & \stackrel{?}{=}-10 \\
-10 & =-10
\end{aligned}
$$

Subtract.

Solving a one-step equation with integers requires you to create zero pairs to isolate the variable.

## Examples:

\#1

$$
\text { Solve: } \begin{aligned}
-2 x & =12 \\
\div-2 & \div-2 \\
x & =-6
\end{aligned}
$$

Check: $-2 x=12$
$-2(-6)=-12$

$$

## Fractions, Decimals \& Percents

## EXAMPLE Changing a Percent to a Fraction

Express $35 \%$ as a fraction.

- Change the percent directly to a fraction with a denominator of 100 . The number of the percent becomes the numerator of the fraction.

$$
35 \%=\frac{35}{100}
$$

- Simplify, if possible.
$\frac{35}{100}=\frac{7}{20}$
$35 \%$ expressed as a fraction is $\frac{7}{20}$.

## EXAMPLE Changing Decimals to Percents

Express 0.7 as a percent.
$0.7 \times 100=70$

- Multiply the decimal by 100.
$0.7 \rightarrow 70 \%$
- Add the percent sign.

So, 0.7 expressed as a percent is $70 \%$.

## EXAMPLE Changing Percents to Decimals

Change $4 \%$ to a decimal.

- Express the percent as a fraction with 100 as the denominator.

$$
4 \%=\frac{4}{100}
$$

- Change the fraction to a decimal by dividing the numerator by the denominator.

$$
4 \div 100=0.04
$$

So, $4 \%=0.04$.
